

# LIGHTperMETER tailored solutions

## Architectural design toolbox

Architectural LED luminaires are mounted horizontally on the wall, ceiling, or on top of the cabinets. They include coves, soffits and valances. Coves distribute light upwards, soffits distribute the light downwards, valances distribute the light up and down

Architectural luminaires provide soft, diffuse ambient light that may need to be supplemented by luminaires in other parts of the room. They can unobtrusively emphasize the architectural design of a space, and can be attractively incorporated into the interior design of a room if they are painted or decorated with mouldings, trims or fabrics.

Tip : avoid lighting ceilings and walls that have surface imperfections.

Use only where wall and ceiling surface are finely finished or interesting, because the grazing light from these architectural luminaires will accentuate imperfections and any other textures.
