LIGHTperMETER's
sensing & control technology

THE INTERNET OF THINGS

Propelled by our desire for an always connected experience, the Internet of Things (IoT) - Internet-enabled devices embedded with microcontrollers and wireless technology, that allows ordinary objects to be connected to the internet, where they can communicate with other ordinary objects and the cloud - is already changing the way consumers are able to control their surroundings.

From thermostats and lighting to remote access and home automation, many are managing comfort, running diagnostics, and receiving alerts about their homes and businesses from devices that can interact seamlessly with mobile clients, cloud services and other IoT devices.
