

LIGHTperMETER's concept & technologies

DEEP LIGHT THROW

The LIGHTperMETER fixture design allows asymmetric light distribution which means more light is distributed to where it is needed to ensure the efficient illumination of a space or a surface.

ASYMMETRICAL LIGHT FIXTURES

Asymmetrical light fixtures offer the following advantages at the work area :

- a computer optimized reflector system directs the light sideways from the lampshade
- no indirect glare to others in the direct vicinity
- strong, even light distribution over a large work area
- no eye contact with the light source – no direct glare
- good level of contrast between workstation and the surrounding area
