

LIGHTperMETER's sensing & control technology

SCENE SETTING

The major advantage of a lighting management system is the ability to control individual lights or groups of lights. This ability allows complex lighting scenes to be created. A room may have multiple scenes pre-set, each one created for different activities in the room. Wireless lighting control systems provide additional benefits including reduced installation costs and increased flexibility over where switches and sensors may be placed.

LIGHT MANAGEMENT

the right light,
in the right amount
at the right place
at the right time.

Light management systems – in general - are a big issue and still too complex and expensive. But very soon, practical app's will enable the consumer to take advantage of digitization. In the near future wireless devices will simplify communications by eliminating control wiring which will reduce much of the expense, complication and disruption of a wired system.

Intelligent, digital light control is growing in importance in all lighting fields for two reasons : first of all, these controls help to implement energy savings up to 75% and secondly, they satisfy the customer's requirements in terms of individual, flexible and dynamic light design.
